Lecture 9 – Regression and Linear Algebra

DSC 40A, Fall 2022 @ UC San Diego
Dr. Truong Son Hy, with help from many others

Announcements

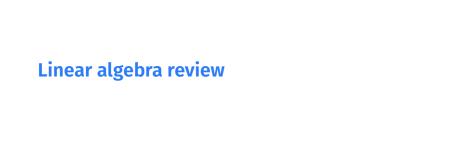

- Look at the readings linked on the course website!
- Groupwork Relsease Day: Thursday afternoon Groupwork Submission Day: Monday midnight Homework Release Day: Friday after lecture Homework Submission Day: Friday before lecture
- See dsc40a.com/calendar for the Office Hours schedule.

Midterm study strategy

- Review the solutions to previous homeworks and groupworks.
- Re-watch lecture, post on Campuswire, come to office hours.
- Look at the past exams at https://dsc40a.com/resources.
- Study in groups.
- Remember: it's just an exam.

Agenda

- Finish linear algebra review.
- Formulate mean squared error in terms of linear algebra.
- Minimize mean squared error using linear algebra.

Dot products

The **dot product** of two vectors \vec{u} and \vec{v} in \mathbb{R}^n is denoted by:

$$\vec{u} \cdot \vec{v} = \vec{u}^T \vec{v}$$

Definition:

$$\vec{u} \cdot \vec{v} = \sum_{i=1}^{n} u_i v_i = u_1 v_1 + u_2 v_2 + \dots + u_n v_n$$

The result is a scalar!

Properties of the dot product

Commutative:

$$\vec{u} \cdot \vec{v} = \vec{v} \cdot \vec{u} = \vec{u}^T \vec{v} = \vec{v}^T \vec{u}$$

Distributive:

$$\vec{u}\cdot(\vec{v}+\vec{w})=\vec{u}\cdot\vec{v}+\vec{u}\cdot\vec{w}$$

Matrix-vector multiplication

- Special case of matrix-matrix multiplication.
- The result is always a vector with the same number of rows as the matrix.
- One view: a "mixture" of the columns.

$$\begin{bmatrix} 1 & 2 & 1 \\ 3 & 4 & 5 \end{bmatrix} \begin{bmatrix} a_1 \\ a_2 \\ a_3 \end{bmatrix} = a_1 \begin{bmatrix} 1 \\ 3 \end{bmatrix} + a_2 \begin{bmatrix} 2 \\ 4 \end{bmatrix} + a_3 \begin{bmatrix} 1 \\ 5 \end{bmatrix}$$

Another view: a dot product with the rows.

Discussion Question

If A is an $m \times n$ matrix and \vec{v} is a vector in \mathbb{R}^n , what are the dimensions of the product $\vec{v}^T A^T A \vec{v}$?

- a) $m \times n$ (matrix)
- b) $n \times 1$ (vector)
- c) 1 × 1 (scalar)
- d) The product is undefined.

Answer: C

Matrices and functions

- Suppose A is an $m \times n$ matrix and \vec{x} is a vector in \mathbb{R}^n .
- Then, the function $f(\vec{x}) = Ax$ is a linear function that maps elements in \mathbb{R}^n to elements in \mathbb{R}^m .
 - ▶ The input to *f* is a vector, and so is the output.
- Key idea: matrix-vector multiplication can be thought of as applying a linear function to a vector.

Mean squared error, revisited

Wait... why do we need linear algebra?

- Soon, we'll want to make predictions using more than one feature (e.g. predicting salary using years of experience and GPA).
 - If the intermediate steps get confusing, think back to this overarching goal.
- Thinking about linear regression in terms of linear algebra will allow us to find prediction rules that
 - use multiple features.
 - ▶ are non-linear.
- Let's start by expressing R_{sq} in terms of matrices and vectors.

Regression and linear algebra

We chose the parameters for our prediction rule

$$H(x) = W_0 + W_1 x$$

by finding the w_0^* and w_1^* that minimized mean squared error:

$$R_{sq}(H) = \frac{1}{n} \sum_{i=1}^{n} (y_i - H(x_i))^2.$$

► This is kind of like the formula for the length of a vector!

Regression and linear algebra

Let's define a few new terms:

- ► The observation vector is the vector $\vec{y} \in \mathbb{R}^n$ with components y_i . This is the vector of observed/"actual" values.
- ► The **hypothesis vector** is the vector $\vec{h} \in \mathbb{R}^n$ with components $H(x_i)$. This is the vector of predicted values.
- The error vector is the vector $\vec{e} \in \mathbb{R}^n$ with components $e_i = y_i H(x_i)$. This is the vector of (signed) errors.

Regression and linear algebra

Let's define a few new terms:

- ► The observation vector is the vector $\vec{y} \in \mathbb{R}^n$ with components y_i . This is the vector of observed/"actual" values.
- The **hypothesis vector** is the vector $\vec{h} \in \mathbb{R}^n$ with components $H(x_i)$. This is the vector of predicted values.
- The error vector is the vector $\vec{e} \in \mathbb{R}^n$ with components $e_i = y_i H(x_i)$. This is the vector of (signed) errors.
- We can rewrite the mean squared error as:

$$R_{sq}(H) = \frac{1}{n} \sum_{i=1}^{n} (y_i - H(x_i))^2 = \frac{1}{n} ||\vec{e}||^2 = \frac{1}{n} ||\vec{y} - \vec{h}||^2.$$

The hypothesis vector

- The hypothesis vector is the vector $\vec{h} \in \mathbb{R}^n$ with components $H(x_i)$. This is the vector of predicted values.
- ► The hypothesis vector \vec{h} can be written

$$\vec{h} = \begin{bmatrix} H(x_1) \\ H(x_2) \\ \vdots \\ H(x_n) \end{bmatrix} = \begin{bmatrix} w_0 + w_1 x_1 \\ w_0 + w_1 x_2 \\ \vdots \\ w_0 + w_1 x_n \end{bmatrix} =$$

The hypothesis vector

- The **hypothesis vector** is the vector $\vec{h} \in \mathbb{R}^n$ with components $H(x_i)$. This is the vector of predicted values.
- The hypothesis vector \vec{h} can be written

$$\vec{h} = \begin{bmatrix} H(x_1) \\ H(x_2) \\ \vdots \\ H(x_n) \end{bmatrix} = \begin{bmatrix} w_0 + w_1 x_1 \\ w_0 + w_1 x_2 \\ \vdots \\ w_0 + w_1 x_n \end{bmatrix} = \begin{bmatrix} 1 & x_1 \\ 1 & x_2 \\ \vdots & \vdots \\ 1 & x_n \end{bmatrix} \begin{bmatrix} w_0 \\ w_1 \end{bmatrix}$$

▶ Define the **design matrix** X to be the $n \times 2$ matrix

$$X = \begin{bmatrix} 1 & x_1 \\ 1 & x_2 \\ \vdots & \vdots \\ 1 & x_n \end{bmatrix}.$$

- ▶ Define the parameter vector $\vec{w} \in \mathbb{R}^2$ to be $\vec{w} = \begin{bmatrix} w_0 \\ w_1 \end{bmatrix}$.
- Then $\vec{h} = X\vec{w}$, so the mean squared error becomes:

$$R_{sq}(H) = \frac{1}{n} ||\vec{y} - \vec{h}||^2$$

$$R_{sq}(\vec{w}) = \frac{1}{n} ||\vec{y} - X\vec{w}||^2$$

Mean squared error, reformulated

Before, our goal was to find the values of w₀ and w₁ that minimize

$$R_{sq}(w_0, w_1) = \frac{1}{n} \sum_{i=1}^{n} (y_i - (w_0 + w_1 x_i))^2$$

► The results:

$$w_1^* = \frac{\sum_{i=1}^n (x_i - \bar{x})(y_i - \bar{y})}{\sum_{i=1}^n (x_i - \bar{x})^2} = r \frac{\sigma_y}{\sigma_x} \qquad w_0^* = \bar{y} - w_1^* \bar{x}$$

Now, our goal is to find the vector \vec{w} that minimizes

$$R_{sq}(\vec{w}) = \frac{1}{n} ||\vec{y} - X\vec{w}||^2$$

Both versions of R_{sa} are equivalent.

Spoiler alert...

ightharpoonup Goal: find the vector \vec{w} that minimizes

$$R_{sq}(\vec{w}) = \frac{1}{n} ||\vec{y} - X\vec{w}||^2$$

► Spoiler alert: the answer¹ is

$$\vec{w^*} = (X^T X)^{-1} X^T \vec{y}$$

Then we'll prove it ourselves by hand.

¹assuming X^TX is invertible

Minimizing mean squared error, again

Some key linear algebra facts

If A and B are matrices, and \vec{u} , \vec{v} , \vec{w} , \vec{z} are vectors:

$$(A + B)^T = A^T + B^T$$

$$\triangleright$$
 $(AB)^T = B^T A^T$

$$\vec{u} \cdot \vec{v} = \vec{v} \cdot \vec{u} = \vec{u}^T \vec{v} = \vec{v}^T \vec{u}$$

$$\|\vec{u}\|^2 = \vec{u} \cdot \vec{u}$$

$$(\vec{u} + \vec{v}) \cdot (\vec{w} + \vec{z}) = \vec{u} \cdot \vec{w} + \vec{u} \cdot \vec{z} + \vec{v} \cdot \vec{w} + \vec{v} \cdot \vec{z}$$

Goal

We want to minimize the mean squared error:

$$R_{\rm sq}(\vec{w}) = \frac{1}{n} ||\vec{y} - X\vec{w}||^2$$

- Strategy: Calculus.
- **Problem:** This is a function of a vector. What does it even mean to take the derivative of $R_{sq}(\vec{w})$ with respect to a vector \vec{w} ?

A function of a vector

Solution: A function of a vector is really just a function of multiple variables, which are the components of the vector. In other words,

$$R_{sq}(\vec{w}) = R_{sq}(w_0, w_1, ..., w_d)$$

where $w_0, w_1, ..., w_d$ are the entries of the vector \vec{w} .²

We know how to deal with derivatives of multivariable functions: the gradient!

 $^{^2}$ In our case, \vec{w} has just two components, w_0 and w_1 . We'll be more general since we eventually want to use prediction rules with even more parameters.

The gradient with respect to a vector

The gradient of $R_{sq}(\vec{w})$ with respect to \vec{w} is the vector of partial derivatives:

$$\nabla_{\vec{w}} R_{sq}(\vec{w}) = \frac{dR_{sq}}{d\vec{w}} = \begin{bmatrix} \frac{\partial R_{sq}}{\partial w_0} \\ \frac{\partial R_{sq}}{\partial w_1} \\ \vdots \\ \frac{\partial R_{sq}}{\partial w_d} \end{bmatrix}$$

where $w_0, w_1, ..., w_d$ are the entries of the vector \vec{w} .

Example: Suppose $f(\vec{x}) = \vec{a} \cdot \vec{x}$, where \vec{a} and \vec{x} are vectors in \mathbb{R}^n . What is $\frac{d}{d\vec{x}} f(\vec{x})$?

Example: Suppose $f(\vec{x}) = \vec{a} \cdot \vec{x}$, where \vec{a} and \vec{x} are vectors in \mathbb{R}^n . What is $\frac{d}{d\vec{x}} f(\vec{x})$?

Keep in mind that $\frac{d}{d\vec{x}}f(\vec{x})$ is a vector of length n in which the i-th element is $\left[\frac{d}{d\vec{x}}f(\vec{x})\right]_i = \frac{\partial f}{\partial x_i}$. We have:

Example: Suppose $f(\vec{x}) = \vec{a} \cdot \vec{x}$, where \vec{a} and \vec{x} are vectors in \mathbb{R}^n . What is $\frac{d}{d\vec{x}} f(\vec{x})$?

Keep in mind that $\frac{d}{d\vec{x}}f(\vec{x})$ is a vector of length n in which the i-th element is $\left[\frac{d}{d\vec{x}}f(\vec{x})\right]_i = \frac{\partial f}{\partial x_i}$. We have:

$$\frac{\partial f}{\partial x_i} = \frac{\partial}{\partial x_i} (\vec{a} \cdot \vec{x}) = \frac{\partial}{\partial x_i} \left(\sum_{i=1}^n a_i \cdot x_i \right) =$$

Example: Suppose $f(\vec{x}) = \vec{a} \cdot \vec{x}$, where \vec{a} and \vec{x} are vectors in \mathbb{R}^n . What is $\frac{d}{d\vec{x}} f(\vec{x})$?

Keep in mind that $\frac{d}{d\vec{x}}f(\vec{x})$ is a vector of length n in which the i-th element is $\left[\frac{d}{d\vec{x}}f(\vec{x})\right]_i = \frac{\partial f}{\partial x_i}$. We have:

$$\frac{\partial f}{\partial x_i} = \frac{\partial}{\partial x_i} (\vec{a} \cdot \vec{x}) = \frac{\partial}{\partial x_i} \left(\sum_{j=1}^n a_j \cdot x_j \right) = \sum_{j=1}^n a_j \cdot \frac{\partial x_j}{\partial x_i}$$

Example: Suppose $f(\vec{x}) = \vec{a} \cdot \vec{x}$, where \vec{a} and \vec{x} are vectors in \mathbb{R}^n . What is $\frac{d}{d\vec{x}} f(\vec{x})$?

Keep in mind that $\frac{d}{d\vec{x}}f(\vec{x})$ is a vector of length n in which the i-th element is $\left[\frac{d}{d\vec{x}}f(\vec{x})\right]_i = \frac{\partial f}{\partial x_i}$. We have:

$$\frac{\partial f}{\partial x_i} = \frac{\partial}{\partial x_i} (\vec{a} \cdot \vec{x}) = \frac{\partial}{\partial x_i} \left(\sum_{j=1}^n a_j \cdot x_j \right) = \sum_{j=1}^n a_j \cdot \frac{\partial x_j}{\partial x_i}$$

If $i \neq j$ then $\frac{\partial x_j}{\partial x_i} = 0$, otherwise 1. Thus: $\frac{\partial f}{\partial x_i} = a_i$. Therefore:

$$\frac{d}{d\vec{x}}f(\vec{x}) = \vec{a}$$

Goal

We want to minimize the mean squared error:

$$R_{\rm sq}(\vec{w}) = \frac{1}{n} ||\vec{y} - X\vec{w}||^2$$

- Strategy:
 - 1. Compute the gradient of $R_{sn}(\vec{w})$.
 - 2. Set it to zero and solve for \vec{w} .
 - ightharpoonup The result is called \vec{w}^* .
- Let's start by rewriting the mean squared error in a way that will make it easier to compute its gradient.

$$R_{\rm sq}(\vec{w}) = \frac{1}{n} ||\vec{y} - X\vec{w}||^2$$

Discussion Question

Which of the following is equivalent to $R_{sa}(\vec{w})$?

- a) $\frac{1}{n}(\vec{y} X\vec{w}) \cdot (X\vec{w} y)$
- b) $\frac{1}{n} \sqrt{(\vec{y} X\vec{w}) \cdot (y X\vec{w})}$ c) $\frac{1}{n} (\vec{y} X\vec{w})^T (y X\vec{w})$ d) $\frac{1}{n} (\vec{y} X\vec{w}) (y X\vec{w})^T$

$$R_{sq}(\vec{w}) = \frac{1}{n} ||\vec{y} - X\vec{w}||^2$$

Discussion Question

Which of the following is equivalent to $R_{sa}(\vec{w})$?

a)
$$\frac{1}{n}(\vec{y} - X\vec{w}) \cdot (X\vec{w} - y)$$

b)
$$\frac{1}{n}\sqrt{(\vec{y} - X\vec{w}) \cdot (y - X\vec{w})}$$

c) $\frac{1}{n}(\vec{y} - X\vec{w})^T(y - X\vec{w})$
d) $\frac{1}{n}(\vec{y} - X\vec{w})(y - X\vec{w})^T$

c)
$$\frac{1}{n}(\vec{y} - X\vec{w})^{T}(y - X\vec{w})$$

d)
$$\frac{1}{n}(\vec{y} - X\vec{w})(y - X\vec{w})^T$$

Answer: C

Because $\|\vec{x}\| = \sqrt{\langle \vec{x}, \vec{x} \rangle} = \sqrt{\vec{x}^T \vec{x}}$, we have:

$$R_{\text{sq}}(\vec{w}) = \frac{1}{n} ||\vec{y} - X\vec{w}||^2 = \frac{1}{n} \langle \vec{y} - X\vec{w}, \vec{y} - X\vec{w} \rangle = \frac{1}{n} (\vec{y} - X\vec{w})^{\mathsf{T}} (\vec{y} - X\vec{w})$$

Because $\|\vec{x}\| = \sqrt{\langle \vec{x}, \vec{x} \rangle} = \sqrt{\vec{x}^T \vec{x}}$, we have:

$$R_{\rm sq}(\vec{w}) = \frac{1}{n} ||\vec{y} - X\vec{w}||^2 = \frac{1}{n} \langle \vec{y} - X\vec{w}, \vec{y} - X\vec{w} \rangle = \frac{1}{n} (\vec{y} - X\vec{w})^{\rm T} (\vec{y} - X\vec{w})$$

We have:

$$R_{sq}(\vec{w}) = \frac{1}{n}(\vec{y}^T - \vec{w}^T X^T)(\vec{y} - X \vec{w}) =$$

Because $\|\vec{x}\| = \sqrt{\langle \vec{x}, \vec{x} \rangle} = \sqrt{\vec{x}^T \vec{x}}$, we have:

$$R_{\rm sq}(\vec{w}) = \frac{1}{n} ||\vec{y} - X\vec{w}||^2 = \frac{1}{n} \langle \vec{y} - X\vec{w}, \vec{y} - X\vec{w} \rangle = \frac{1}{n} (\vec{y} - X\vec{w})^{\rm T} (\vec{y} - X\vec{w})$$

We have:

$$R_{sq}(\vec{w}) = \frac{1}{n} (\vec{y}^T - \vec{w}^T X^T) (\vec{y} - X \vec{w}) = \frac{1}{n} (\vec{y}^T \vec{y} - \vec{w}^T X^T \vec{y} - \vec{y}^T X \vec{w} + \vec{w}^T X^T X \vec{w})$$

Rewriting mean squared error

Because $\|\vec{x}\| = \sqrt{\langle \vec{x}, \vec{x} \rangle} = \sqrt{\vec{x}^T \vec{x}}$, we have:

$$R_{\text{sq}}(\vec{w}) = \frac{1}{n} ||\vec{y} - X\vec{w}||^2 = \frac{1}{n} \langle \vec{y} - X\vec{w}, \vec{y} - X\vec{w} \rangle = \frac{1}{n} (\vec{y} - X\vec{w})^T (\vec{y} - X\vec{w})$$

We have:

$$R_{\text{sq}}(\vec{w}) = \frac{1}{n}(\vec{y}^{T} - \vec{w}^{T}X^{T})(\vec{y} - X\vec{w}) = \frac{1}{n}(\vec{y}^{T}\vec{y} - \vec{w}^{T}X^{T}\vec{y} - \vec{y}^{T}X\vec{w} + \vec{w}^{T}X^{T}X\vec{w})$$

Keep in mind that $\vec{w}^T X^T \vec{y} = \vec{y}^T X \vec{w}$ is a symmetric 1 × 1 matrix or scalar.

Rewriting mean squared error

Because $\|\vec{x}\| = \sqrt{\langle \vec{x}, \vec{x} \rangle} = \sqrt{\vec{x}^T \vec{x}}$, we have:

$$R_{\text{sq}}(\vec{w}) = \frac{1}{n} ||\vec{y} - X\vec{w}||^2 = \frac{1}{n} \langle \vec{y} - X\vec{w}, \vec{y} - X\vec{w} \rangle = \frac{1}{n} (\vec{y} - X\vec{w})^T (\vec{y} - X\vec{w})$$

We have:

$$R_{\rm sq}(\vec{w}) = \frac{1}{n} (\vec{y}^T - \vec{w}^T X^T) (\vec{y} - X \vec{w}) = \frac{1}{n} (\vec{y}^T \vec{y} - \vec{w}^T X^T \vec{y} - \vec{y}^T X \vec{w} + \vec{w}^T X^T X \vec{w})$$

Keep in mind that $\vec{w}^T X^T \vec{y} = \vec{y}^T X \vec{w}$ is a symmetric 1×1 matrix or scalar. We can even write them down as $X^T \vec{y} \cdot \vec{w}$ where \cdot is dot product. We finally have:

Rewriting mean squared error

Because $\|\vec{x}\| = \sqrt{\langle \vec{x}, \vec{x} \rangle} = \sqrt{\vec{x}^T \vec{x}}$, we have:

$$R_{\rm sq}(\vec{w}) = \frac{1}{n} \|\vec{y} - X\vec{w}\|^2 = \frac{1}{n} \langle \vec{y} - X\vec{w}, \vec{y} - X\vec{w} \rangle = \frac{1}{n} (\vec{y} - X\vec{w})^T (\vec{y} - X\vec{w})$$

We have:

$$R_{\text{sq}}(\vec{w}) = \frac{1}{n}(\vec{y}^{T} - \vec{w}^{T}X^{T})(\vec{y} - X\vec{w}) = \frac{1}{n}(\vec{y}^{T}\vec{y} - \vec{w}^{T}X^{T}\vec{y} - \vec{y}^{T}X\vec{w} + \vec{w}^{T}X^{T}X\vec{w})$$

Keep in mind that $\vec{w}^T X^T \vec{y} = \vec{y}^T X \vec{w}$ is a symmetric 1×1 matrix or scalar. We can even write them down as $X^T \vec{y} \cdot \vec{w}$ where \cdot is dot product. We finally have:

$$R_{\text{sq}}(\vec{w}) = \frac{1}{n} (\vec{y}^{\mathsf{T}} \vec{y} - 2X^{\mathsf{T}} \vec{y} \cdot \vec{w} + \vec{w}^{\mathsf{T}} X^{\mathsf{T}} X \vec{w})$$

$$\frac{dR_{sq}}{d\vec{w}} = \frac{d}{d\vec{w}} \left(\frac{1}{n} \left[\vec{y} \cdot \vec{y} - 2X^T \vec{y} \cdot \vec{w} + \vec{w}^T X^T X \vec{w} \right] \right)$$

$$= \frac{1}{n} \left[\frac{d}{d\vec{w}} \left(\vec{y} \cdot \vec{y} \right) - \frac{d}{d\vec{w}} \left(2X^T \vec{y} \cdot \vec{w} \right) + \frac{d}{d\vec{w}} \left(\vec{w}^T X^T X \vec{w} \right) \right]$$

$$\begin{split} \frac{dR_{\text{sq}}}{d\vec{w}} &= \frac{d}{d\vec{w}} \left(\frac{1}{n} \left[\vec{y} \cdot \vec{y} - 2X^T \vec{y} \cdot \vec{w} + \vec{w}^T X^T X \vec{w} \right] \right) \\ &= \frac{1}{n} \left[\frac{d}{d\vec{w}} \left(\vec{y} \cdot \vec{y} \right) - \frac{d}{d\vec{w}} \left(2X^T \vec{y} \cdot \vec{w} \right) + \frac{d}{d\vec{w}} \left(\vec{w}^T X^T X \vec{w} \right) \right] \end{split}$$

- $\qquad \qquad \frac{d}{d\vec{w}} \left(\vec{y} \cdot \vec{y} \right) = 0.$
 - ightharpoonup Why? \vec{y} is a constant with respect to \vec{w} .
- - ▶ Why? We already showed $\frac{d}{d\vec{x}}\vec{a} \cdot \vec{x} = \vec{a}$.
- $\qquad \qquad \frac{d}{d\vec{w}} \left(\vec{w}^T X^T X \vec{w} \right) = 2 X^T X \vec{w}.$
 - Why? Your homework!

$$\frac{dR_{sq}}{d\vec{w}} = \frac{d}{d\vec{w}} \left(\frac{1}{n} \left[\vec{y} \cdot \vec{y} - 2X^T \vec{y} \cdot \vec{w} + \vec{w}^T X^T X \vec{w} \right] \right)$$

$$= \frac{1}{n} \left[\frac{d}{d\vec{w}} \left(\vec{y} \cdot \vec{y} \right) - \frac{d}{d\vec{w}} \left(2X^T \vec{y} \cdot \vec{w} \right) + \frac{d}{d\vec{w}} \left(\vec{w}^T X^T X \vec{w} \right) \right]$$

$$\frac{dR_{sq}}{d\vec{w}} = \frac{d}{d\vec{w}} \left(\frac{1}{n} \left[\vec{y} \cdot \vec{y} - 2X^T \vec{y} \cdot \vec{w} + \vec{w}^T X^T X \vec{w} \right] \right)$$

$$= \frac{1}{n} \left[\frac{d}{d\vec{w}} \left(\vec{y} \cdot \vec{y} \right) - \frac{d}{d\vec{w}} \left(2X^T \vec{y} \cdot \vec{w} \right) + \frac{d}{d\vec{w}} \left(\vec{w}^T X^T X \vec{w} \right) \right]$$

$$\frac{dR_{sq}}{d\vec{w}} = \frac{1}{n} \left[-2X^T \vec{y} + 2X^T X \vec{w} \right]$$

The normal equations

To minimize $R_{sq}(\vec{w})$, set its gradient to zero and solve for \vec{w} :

$$-2X^{T}\vec{y} + 2X^{T}X\vec{w} = 0$$
$$\implies X^{T}X\vec{w} = X^{T}\vec{y}$$

- ► This is a system of equations in matrix form, called the normal equations.
- If X^TX is invertible, the solution is

$$\vec{W}^* = (X^T X)^{-1} X^T \vec{y}$$

- This is equivalent to the formulas for w_0^* and w_1^* we saw before!
 - Benefit this can be easily extended to more complex prediction rules.

Side note — another proof

We set out to minimize

$$R_{sq}(\vec{w}) = \frac{1}{n} ||\vec{y} - X\vec{w}||^2$$

- ► We did it using multivariable calculus.
- ► There's another proof of this same fact that relies on knowledge of linear projections. We will not cover it in class and you are not responsible for it, but you can watch video 13.4 here if you're curious: http://ds100.org/su20/lecture/lec13/.

Summary

Summary

We used linear algebra to rewrite the mean squared error for the prediction rule $H(x) = w_0 + w_1 x$ as

$$R_{sq}(\vec{w}) = \frac{1}{n} ||\vec{y} - X\vec{w}||^2$$

- ► X is called the **design matrix**, \vec{w} is called the **parameter vector**, \vec{y} is called the **observation vector**, and $\vec{h} = X\vec{w}$ is called the **hypothesis vector**.
- We minimized $R_{sq}(\vec{w})$ using multivariable calculus and found that the minimizing \vec{w} satisfies the **normal** equations, $X^T X \vec{w} = X^T y$.
 - Closed-form solution:

$$\vec{w}^* = (X^T X)^{-1} X^T \vec{y}$$

What's next?

- The whole point of reformulating linear regression in terms of linear algebra was so that we could generalize our work to more sophisticated prediction rules.
 - Note that when deriving the normal equations, we didn't assume that there was just one feature.
- Examples of the types of prediction rules we'll be able to fit soon:

$$\vdash H(x) = W_0 + W_1 x + W_2 x^2.$$

$$H(x) = W_0 + W_1 \cos(x) + W_2 e^x$$
.

$$H(x^{(1)}, x^{(2)}) = W_0 + W_1 x^{(1)} + W_2 x^{(2)}.$$
